Survey Question: Would you be interested in receiving an electronic copy of the Spring Tree and Supply Catalog in the future? (Make sure to provide email) YES NO

Consider the following items to plan your planting:

- 1) **Select the location and site for your spring planting.** Consult your county conservation district for planting consideration if needed.
- 2) **Consider the purpose of your planting:** i.e., future timber, wildlife cover or food, erosion control, etc. This information will help you determine the proper spacing between plants and between rows.
- 3) **Obtain site information:** Soil type, exposure (south facing, north facing, etc.) and slope. This will help you decide on the species of trees or shrubs best suited to the location and site.
- 4) **Identify and review planting method:** Will you be hand planting with a shovel, using a mechanical planter, or planting transplants with a power posthole digger, etc.?
- 5) **Plan for and scout for pests and special problems prior to planting.** What type(s) of weeds are present? Are rabbits, deer, mice or certain insects likely to be a problem? Tree shelters (or protectors) increase survival significantly and reduce damage by rodents and deer.
- 6) **Maintenance of your planting:** Weed control will probably be needed for a minimum of 3-years after planting if competition is severe. Scout plantings regularly for insect, weed, animal and disease problems.
- 7) **Follow label closely when applying pesticides.** Remember besides causing mechanical damage to the trees, mowing is not considered an effective weed control for forest or conservation plantings.
